Software Inventory — Free

User manual | Version 1.3

Release documentation | October 2026

Use only on systems you own or are authorized to administer. Review all commands before running them.

1. Overview

AdminOps Software Inventory Free v1.3 is a read-only Windows application inventory utility. It scans registered uninstall entries, displays application name, version and publisher, filters by application name, and exports a CSV report.

Free does not uninstall software. It contains no removal engine or hidden Pro unlock option.

2. Requirements and installation

Windows 10 or Windows 11 with Windows PowerShell 5.1 and an interactive Windows desktop.

Download **AdminOps-Software-Inventory-Free-v1.3.zip** from the AdminOps Toolkit website. Extract the complete ZIP to a folder you control. Keep the **Free-Edition** folder and its subfolders together.

Open **Free-Edition** and double-click **Start-GUI.cmd**. If Windows shows a security prompt, verify the source and review the script before allowing execution.

3. Scan and search

The window scans registered software when it opens. The table shows **Name**, **Version**, and **Publisher**.

Type part of an application name into the search field to narrow the visible results. Clear the field to show all detected entries.

Select **Refresh** to rescan. The status line shows how many applications are displayed out of the total detected.

4. Export a CSV report

Select **Export CSV**, choose a destination and filename, and save. The default suggested name is **AdminOps-Software-Inventory.csv**.

Important: Export CSV writes the complete scanned inventory, not only the currently filtered rows. The CSV includes Name, Version, and Publisher.

The included command-line exporter can also generate a report:

```
powershell.exe -NoProfile -File .\Export-Inventory.ps1 -Path "$env:USERPROFILE\Desktop\inventory.csv"
```

Run this command from the **Free-Edition** folder.

5. Limitations and troubleshooting

Inventory comes from Windows uninstall registry entries. Portable applications, some Microsoft Store applications, and applications installed under other user profiles may not appear.

If no software appears, select Refresh, verify Windows PowerShell 5.1 is available, and review any scan error shown in the window.

If CSV export fails, select a writable folder and verify the destination file is not locked by another program.

Treat exported inventory as internal system information; share and store it appropriately.

6. Package contents

Start-GUI.cmd — GUI launcher. **GUI/AdminOps-Inventory-GUI.ps1** — Windows Forms interface. **Core/AdminOps.Inventory.psm1** — inventory scanner. **Export-Inventory.ps1** — CSV export command. **README.md** — package notes.

7. Support and upgrade

For removal features, use **AdminOps Software Uninstaller Pro v1.3.1**, included with an active AdminOps Toolkit Pro membership.
